

# Q

## How are Objects defined in JavaScript?

# Javascript objects

JavaScript is confusing for developers coming from Java or C++, as it's all dynamic, all runtime, and it **has no classes at all**.

It's all just instances (objects).

Even the "classes" we simulate (introduced in ES5) are just a **function** object.

*from developer.mozilla.org*

# Javascript objects as data structures

Javascript objects are collections of **named values (properties)**

```
var person = {firstName:"Dorothea",  
              lastName:"Wierer", birthyear:1990};
```

Javascript objects can contain also **methods**

```
var person = {firstName:"Dorothea",  
              lastName:"Wierer", birthyear:1990,  
              fullName:function() {return this.firstName  
+ " " + this.lastName;}};
```

# Accessing properties

```
person.firstName
```

is equivalent to

```
person["firstName"];
```

and to

```
var x="firstName";  
person[x];
```

# Dynamic management of objects

You can dynamically add new properties to an existing object by simply giving it a value.

```
var person = {firstName:"Dorothea",  
              lastName:"Wierer", birthyear:1990};  
person.birthplace="Brunico";
```

You can also delete existing properties.

```
delete person.firstName;
```

# Other ways to create objects

Hence, Javascript objects can also be created empty and populated later.

```
var person = {};  
  person.firstName="Dorothea";  
  person.lastName:"Wierer";  
  person.birthyear:1990;  
  person.fullName=function() {  
    return this.firstName + " " +  
    this.lastName;};
```

# "Object" is a misleading name!

If you come from a language like Java, where objects are instances of classes, you will notice that the "Object" notion of Javascript is quite different!

For instance:

- you can not change the structure of a Java object, but you can change the structure of a JavaScript object!
- you cannot have objects without class in Java, but you do in JavaScript!

# Other ways to create object

```
var object1 = new Object();  
Object.defineProperty(  
  object1, 'name', {  
    value: "AA",  
    writable: false  
  });  
object1.name = 77;  
document.write(object1.name);
```

OUTPUT:

AA

(but no error)

**if writable:true:**

OUTPUT:

77

# Objects constructors

Object constructors: templates for creating objects of a certain type (somehow similar to the concept of "class").

```
function Rectangle(w, h) {  
  this.width=w; ← Instance variables  
  this.height=h; ← Instance variables  
  this.area=function() {return this.width*this.height}  
} ← method  
a=new Rectangle(3,4);    a.area() => 12    a.width => 3
```

*The constructor function is JavaScript's version of a class.*

# Odd consequences...

```
<script>
p = (n,s) => document.write(n+": "+s+"<br>");
function Rectangle(w, h) {
    this.width=w;
    this.height=h;
    this.area=function() {
        return this.width*this.height;
    }
}
a=new Rectangle(2,3);
b=new Rectangle(2,3);
p(a.area(),b.area());
a.area=function(){return this.width*5};
p(a.area(),b.area());
</script>
```

OUTPUT:

6:6

10:6

# Q

## What are prototypes?

# Objects

The approach we have shown is not the most efficient in terms of memory allocation, as for every Rectangle we instantiate the area method!

It would be better to use the “prototype” feature.

```
Rectangle.prototype.area=function() {  
    return this.w*this.h  
}
```

# Prototype

The Prototype is a **separate naming space**, shared by all instances of the same constructor/class

```
function Person(first, last ) {
    this.firstname = first;
    this.lastname = last;
}
Person.prototype.fullname= function () {
    return this.firstname+" "+this.lastname
};
Person.prototype.nickname="The Best";
let person1 = new Person('Dorothea', 'Wierer');
let person2 = new Person('Valentino', 'Rossi');
console.log(person1.nickname);
console.log(person2.nickname);
Person.prototype.nickname="The Champion";
console.log(person1.nickname);
console.log(person2.nickname);
```

OUTPUT:

The Best

The Best

The Champion

The Champion

# Prototype

The `Object.create()` method creates a new object, using an existing object as the prototype of the newly created object.

OUTPUT:

The Best

The Best

The Champion

The Champion

# Q

## How can I inspect objects?

# Inspecting objects

```
<script>f
x = new Rectangle(3,4);
for (e in x) { // loop over all properties
  console.log(e+" "+x[e]);
}
```

name of the property      value of the property

If you only want to consider properties attached to the object itself, and **not its prototypes**, use [getOwnPropertyNames\(\)](#) or perform a [hasOwnProperty\(\)](#) check.

[propertyIsEnumerable\(\)](#) can also be used.

# Using the console

The screenshot shows a browser's developer console with the 'Sources' tab active. A JavaScript function `Person` is defined in `prova.html`. The function has a `name` property and a `fullname` method. A `person1` object is created with `first: 'Dorothea'` and `last: 'Wierer'`. The console log shows the output of `person1.fullname()`, which is `Dorothea Wierer`. A context menu is open over the `fullname` property of the `person1` object, showing its prototype chain and methods.

```
9 <script>
10   function Person(first, last ) {
11     // property and method definitions
12     this.name = {
13       'first': first,
14       'last': last
15     };
16     this.fullname = function () {return this.name.first+" "+this.name.last};
17   }
18   let person1 = new Person('Dorothea', 'Wierer');
19   console.log(person1.fullname());
20 </script>
21 </body>
```

< "AAA Wierer"

# Q

## Can I have object inheritance in JavaScript?

# Using an object as prototype of another object

```
function Person() {
  this.isHuman=false;
  this.printIntroduction=function() {
    document.write("My name is "+this.name+
      ". Am I human? "+this.isHuman);
  }
}

pippo=new Person();
pippo.printIntroduction();

const me = Object.create(pippo);
// "name" is a property set on "me",
// but not on "person"
me.name = 'Matthew';
// inherited properties can be overwritten
me.isHuman = true;
me.printIntroduction();
```

```
My name is
undefined.
Am I human? false
```

```
My name is Matthew.
Am I human? true"
```

# Prototype

Moreover, the Prototype is used for providing a sort of inheritance.

# Prototype-based inheritance - 1

```
function Person(first, last ) {
    this.firstname = first;
    this.lastname = last;
}
Person.prototype.nickname="The Best";
Person.prototype.fullname= function () {
    return this.firstname+" "+this.lastname};
```

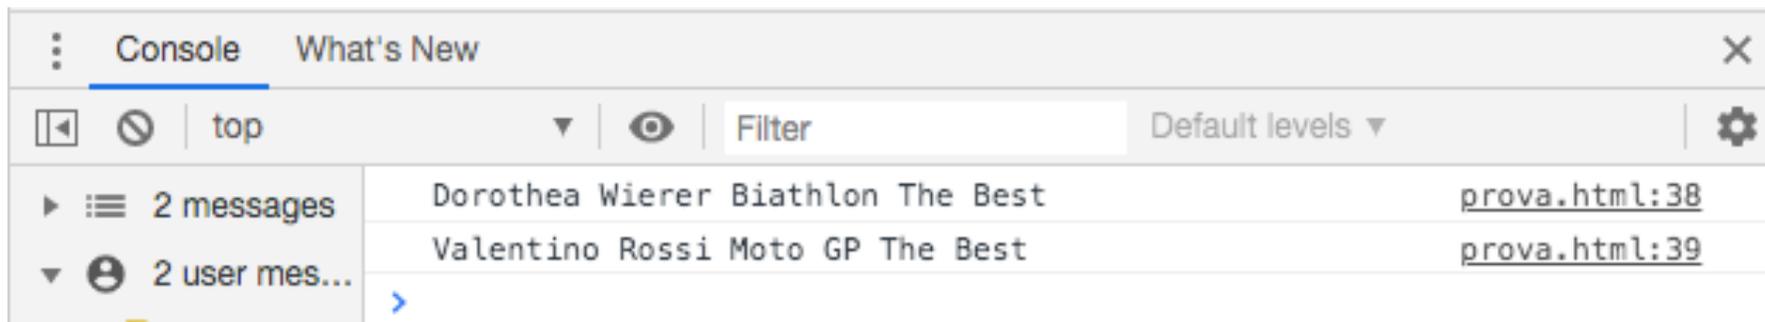

```
function Athlete(first, last, sport ) {
    Person.call(this,first,last);
    this.sport=sport;
}
Athlete.prototype = Object.create(Person.prototype);
Object.defineProperty(Athlete.prototype, 'constructor', {
    value: Athlete,
    enumerable: false,
    writable: true });
```

so that it does not  
appear in 'for in' loop

# Prototype-based inheritance - 2

```
let person1 = new Athlete('Dorothea', 'Wierer', 'Biathlon');  
let person2 = new Athlete('Valentino', 'Rossi', 'Moto GP');  
  
console.log(person1.fullname()+" "+person1.sport+" "+person1.nickname);  
console.log(person2.fullname()+" "+person2.sport+" "+person2.nickname);
```

# Prototype-based inheritance

## - 3

```
function Person(first, last ) {
    this.firstname = first;
    this.lastname = last;
}
Person.prototype = Object.create(Object.prototype);
Object.defineProperty(Person.prototype, 'constructor', {
    value: Person,
    enumerable: false,
    writable: true });
Person.prototype.nickname="The Best";
Person.prototype.fullname= function () {
    return this.firstname+" "+this.lastname};
```

IMPLICIT

```
function Athlete(first, last, sport ) {
    Person.call(this,first,last);
    this.sport=sport;
}
Athlete.prototype = Object.create(Person.prototype);
Object.defineProperty(Athlete.prototype, 'constructor', {
    value: Athlete,
    enumerable: false,
    writable: true });
```

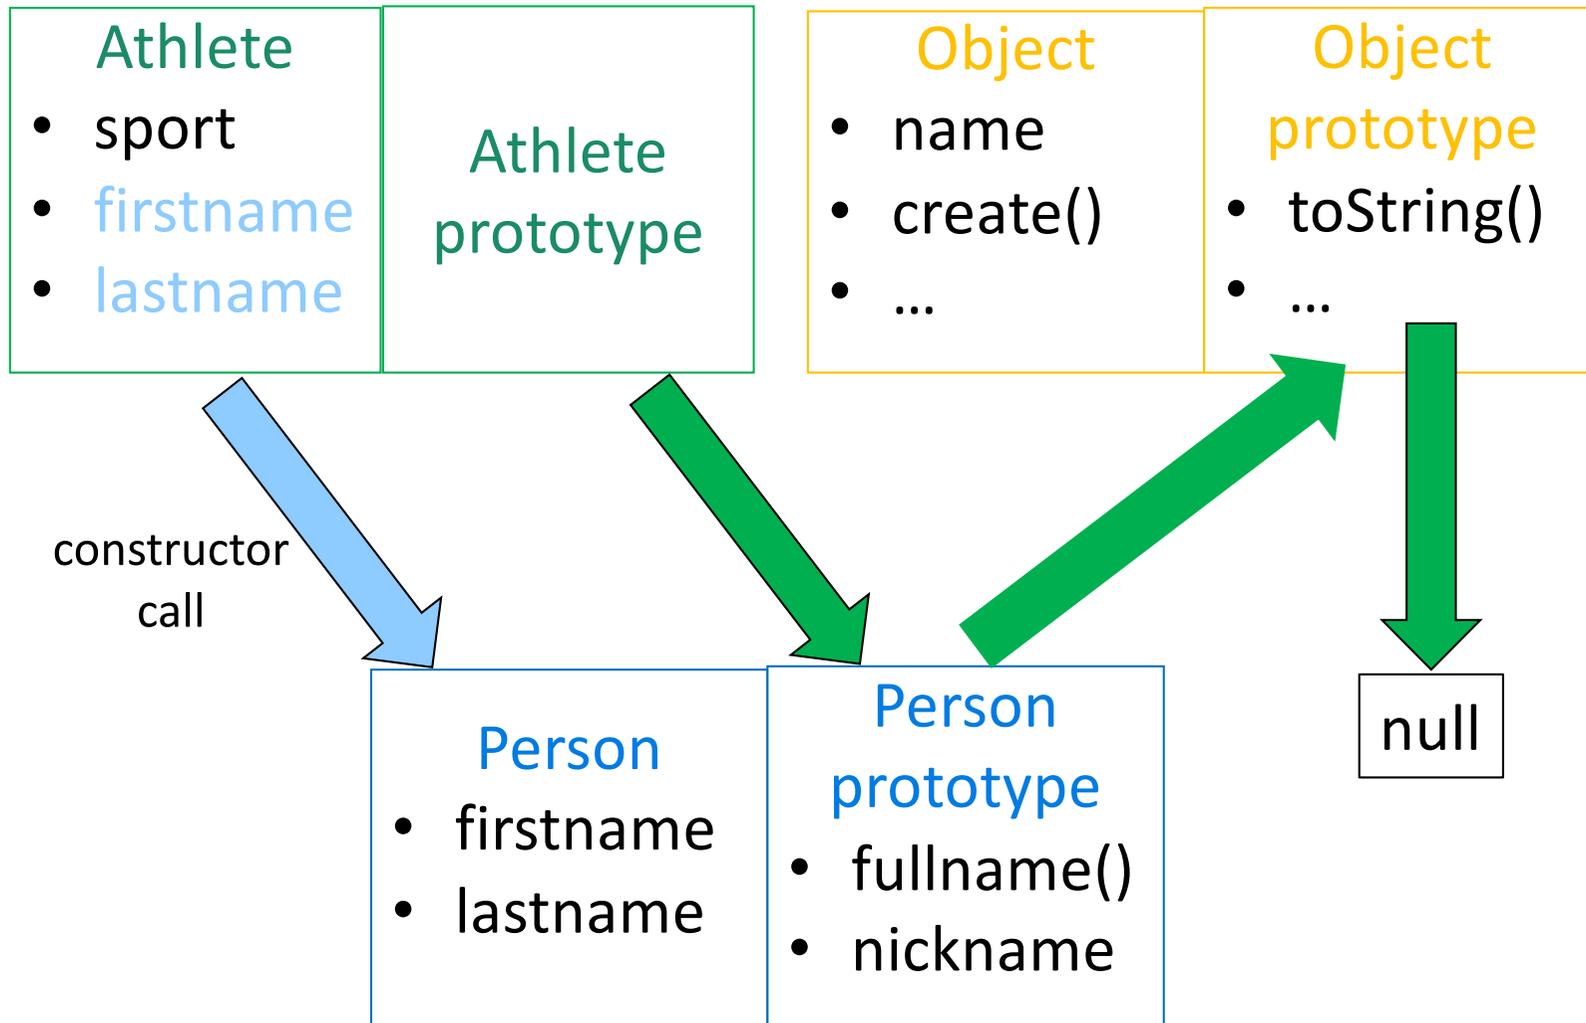

# Prototype-based inheritance - 4

In the constructor we define the instance variables of our instances.

In the prototype we define the methods, and the variables shared by all our instances.

By invoking the "superclass" constructor, we inherit its instance variables.

By associating or prototype to the "superclass", we inherit its prototype.

# Warning!

```
function Person(first, last ) {
    this.firstname = first;
    this.lastname = last;
}
Person.prototype.nickname="The Best";
let person1 = new Person('Dorothea', 'Wierer');
let person2 = new Person('Valentino', 'Rossi');
console.log(person1.nickname);
console.log(person2.nickname);
Person.prototype.nickname="The Champion";
console.log(person1.nickname);
console.log(person2.nickname);
person1.nickname="The Magic";
console.log(person1.nickname);
console.log(person2.nickname);
delete person1.nickname;
console.log(person1.nickname);
console.log(person2.nickname);
```

## OUTPUT:

The Best

The Best

The Champion

The Champion

The Magic

The Champion

The Champion

# Property inheritance: demo

```
function A(p) {
  this.a1 = p;
  this.a2 = "due";
}
A.prototype.a3="tre";
A.prototype.a4="quattro";
```

```
let v1 = new A("uno_A");
let v2 = new B("uno_B");
for (e in v1) {
  console.log("=> A "+e+"
"+v1[e]);
}
for (e in v2) {
  console.log("B "+e+"
"+v2[e]);
}
```

```
function B(p) {
  A.call(this,p);
  this.b1="cinque";
}
B.prototype = Object.create(A.prototype);
Object.defineProperty(B.prototype,
  'constructor',
  { value: B,
    enumerable: false,
    writable: true });
B.prototype.a4="sei";
```

=> A a1 uno\_A from A.constructor param

=> A a2 due def. in A.constructor

=> A a3 tre  
in A.prototype

=> A a4 quattro

B a1 uno\_B from B.constructor param

B a2 due def. in A.constructor

B b1 cinque def. in B.constructor

B a4 sei def. in A.prototype, overwrt in B.prototype

B a3 tre def. in A.prototype

# Prototype-based inheritance - 5

For an in-depth discussion, see

[https://developer.mozilla.org/en-US/docs/Web/JavaScript/Inheritance\\_and\\_the\\_prototype\\_chain#Using\\_prototypes\\_in\\_JavaScript](https://developer.mozilla.org/en-US/docs/Web/JavaScript/Inheritance_and_the_prototype_chain#Using_prototypes_in_JavaScript)

# Q

**Are there predefined objects in JavaScript?**

# Predefined objects

JavaScript has a number of predefined objects, e.g.:

```
var x1 = new Object();  
var x2 = new String(); // do not use it!  
var x3 = new Number(); // do not use it!  
var x4 = new Boolean(); // do not use it!  
var x5 = new Array(); // do not use it! Use []  
var x6 = new RegExp(); // do not use it! Use /( )/  
var x7 = new Function(); // do not use it!  
var x8 = new Date();
```

The native prototypes should **never** be extended unless it is for the sake of compatibility with newer JavaScript features.

# Predefined objects

- **Math** is an object you never instantiate – it's a container for math functions.
  - [https://www.w3schools.com/js/js\\_math.asp](https://www.w3schools.com/js/js_math.asp)
  - [https://www.w3schools.com/js/js\\_random.asp](https://www.w3schools.com/js/js_random.asp)
- **Date**
  - [https://www.w3schools.com/js/js\\_dates.asp](https://www.w3schools.com/js/js_dates.asp)
- **RegExp**
  - [https://www.w3schools.com/js/js\\_regexp.asp](https://www.w3schools.com/js/js_regexp.asp)

[https://www.w3schools.com/js/js\\_math.asp](https://www.w3schools.com/js/js_math.asp)

# Q

**So, there are no classes in  
JavaScript?**

# Classes

JavaScript classes, introduced in ECMAScript 2015, are primarily **syntactic sugar** over JavaScript's existing prototype-based inheritance. The class syntax *does not* introduce a new object-oriented inheritance model to JavaScript.

Unlike function declarations, and **class declarations are not hoisted.**

# Classes

```
class Person {  
    constructor(first, last ) {  
        this.firstname = first;  
        this.lastname = last;  
    }  
    fullname() {  
        return this.firstname+" "+this.lastname;  
    }  
}
```

```
class Athlete extends Person {  
    constructor(first, last, sport ) {  
        super(first,last);  
        this.sport=sport;  
    }  
}
```

```
let person1 = new Athlete('Dorothea', 'Wierer', 'Biathlon');  
let person2 = new Athlete('Valentino', 'Rossi', 'Moto GP');  
  
console.log(person1.fullname()+" "+person1.sport);  
console.log(person2.fullname()+" "+person2.sport);
```

Instance variables can ONLY be defined within methods.  
"Regular" instance variables have been proposed for future versions, see: <https://tc39.es/>

## Classes

Class variables (like the java static ones) can be defined, but they cannot be called on instances.

```
Person.nickname="The Champion";  
let person1 = new Athlete('Dorothea', 'Wierer', 'Biathlon');  
let person2 = new Athlete('Valentino', 'Rossi', 'Moto GP');  
console.log(person1.fullname()+" "+person1.sport+" "+Person.nickname);  
console.log(person2.fullname()+" "+person2.sport+" "+person2.nickname);
```

```
Dorothea Wierer Biathlon The Champion  
Valentino Rossi Moto GP undefined
```

```
Person.nickname="The Champion";  
Person.prototype.nickname="The Best";  
let person1 = new Athlete('Dorothea', 'Wierer', 'Biathlon');  
let person2 = new Athlete('Valentino', 'Rossi', 'Moto GP');  
console.log(person1.fullname()+" "+person1.sport+" "+Person.nickname);  
console.log(person2.fullname()+" "+person2.sport+" "+person2.nickname);
```

```
Dorothea Wierer Biathlon The Champion  
Valentino Rossi Moto GP The Best
```

# Classes

Class methods (like the java static ones) can be defined, but they cannot be called on instances.

```
class Person {
  constructor(first, last, birthYear) {
    this.firstname = first;
    this.lastname = last;
    this.birthYear = birthYear;
  }
  static getAge(p) { // we cannot use this inside here!
    let dt=new Date();
    let thisyear=dt.getFullYear();
    return thisyear-p.birthYear;
  }
  fullname() {
    return this.firstname+" "+this.lastname;
  }
}
let person1 = new Person('Dorothea', 'Wierer',1990);
console.log(person1.fullname()+" "+Person.getAge(person1) );
```

OUTPUT:

Dorothea Wierer 30

# Q

## What are, exactly, arrays in Javascript?

# Arrays

```
a=[];  
a = new Array(); //discouraged  
a[0]=3; a[1]="hello"; a[10]=new Rectangle(2,2);  
a.length() => 11;  
  
a["name"]="Jaric"; ⇔ a.name="Jaric";
```

Arrays are

**SPARSE, INHOMOGENEOUS, ASSOCIATIVE**

See [https://developer.mozilla.org/en-US/docs/Web/JavaScript/Reference/Global\\_Objects/Array](https://developer.mozilla.org/en-US/docs/Web/JavaScript/Reference/Global_Objects/Array)

# Arrays

Array give you functions to (e.g.):

- add/remove an element at the end
- add/remove an element at the front
- add/remove an element by index
- remove a number of elements starting from an index
- find the index of an element
- make a copy of an array

See [https://developer.mozilla.org/en-US/docs/Web/JavaScript/Reference/Global\\_Objects/Array](https://developer.mozilla.org/en-US/docs/Web/JavaScript/Reference/Global_Objects/Array)

# Arrays

See also a set of examples of common tasks performed on array (such as e.g. find the maximum, sort):

- [https://www.w3schools.com/js/js\\_array\\_sort.asp](https://www.w3schools.com/js/js_array_sort.asp)
- [https://www.w3schools.com/js/js\\_array\\_iteration.asp](https://www.w3schools.com/js/js_array_iteration.asp)

# Q

**How does the + operator work on objects?**

# + Operator with objects

We already know that the first rule with the + operator is to convert objects to primitive values.

The rule to execute the conversion is:

Check if the object:

- is not a Date AND
- has a valueOf() method AND
- its valueOf() method returns a primitive value.

If yes, use the valueOf() method.

Else, use the toString() method.

**Note:** the array [1,"a",2] would be converted to "1,a,2".

An empty object {} is converted to "[object Object]"
